

Task 02 – Prompting for Creativity

SkillCraft Technology | Prompt Engineering Internship

Objective

Explore how different prompt structures and techniques affect the **creativity, tone, and quality** of LLM outputs by designing and comparing 3 prompt variants for the same creative goal.

Creative Goal: Startup Idea Generation

I chose **startup idea generation** as the creative task — a domain where creativity, specificity, and real-world relevance all matter.

Prompt Variant 1 — Vague / Zero-Shot

Prompt:

Give me a startup idea.

Output:

"An app that connects freelancers with clients."

Evaluation:

Criteria	Result
Tone	Neutral
Creativity	★ (very generic)
Detail	✗ None
Usability	✗ Not usable

Prompt Variant 2 — Structured + Context

Prompt:

Generate a unique startup idea in the health-tech space that solves a real problem for people in rural areas. Describe the idea in 3 sentences covering: what it does, who it's for, and how it makes money.

Output:

RuralMed AI is a mobile app that uses AI to help people in remote villages diagnose common illnesses by answering a series of symptom-based questions and connecting them with an online doctor within minutes. It targets underserved rural populations who lack access to nearby hospitals or clinics. The app earns revenue through a small consultation fee and partnerships with local pharmacies for medicine delivery.

Evaluation:

Criteria	Result
Tone	Professional
Creativity	★★★★
Detail	✅ Strong
Usability	✅ Good

Prompt Variant 3 — Few-Shot Prompting (Best Practice)

Prompt:

Here are two examples of creative startup ideas:

Example 1: SleepCoach AI - An app that analyzes your sleep patterns via your phone's microphone and gives personalized bedtime routines. Targets stressed professionals.
Revenue: monthly subscription.

Example 2: FarmLink - A platform connecting small farmers directly to restaurants, cutting out middlemen. Targets local food ecosystems. Revenue: 5% transaction fee.

Now generate a similarly creative and detailed startup idea in the education technology space for students in developing countries.

Output:

LearnOffline is an AI-powered learning app that downloads personalized lesson plans and quizzes to students' phones so they can study without internet access — syncing progress automatically when connectivity is restored. It targets middle and high school students in low-connectivity regions of South Asia and Africa who struggle with unreliable internet. The business model combines affordable prepaid data bundles with school district licensing fees, making it sustainable without relying on student purchases.

Evaluation:

Criteria	Result
Tone	Inspiring & Specific
Creativity	★★★★★
Detail	✓✓ Excellent
Usability	✓✓ Highly usable

Comparison Table

	Variant 1 (Vague)	Variant 2 (Structured)	Variant 3 (Few-Shot)
Technique	Zero-shot	Constrained prompt	Few-shot
Tone	Flat	Professional	Inspiring
Creativity	★	★★★★	★★★★★
Detail	None	Good	Excellent
Usability	✗	✓	✓✓

Key Learnings

Technique	Effect on Output
Vague prompts	Generic, unusable results
Adding context & structure	Focused, relevant, detailed output
Few-shot examples	Model mirrors style, tone & depth — best results
Specifying audience	Grounds creativity in real-world relevance
Defining format	Ensures output is organized and complete

Conclusion

Few-shot prompting produced the most creative, detailed, and usable output. Providing examples teaches the model the *style and depth* you expect — far more effectively than instructions alone.

The progression from Variant 1 → 2 → 3 clearly demonstrates that:

- **Clarity** removes ambiguity
 - **Structure** guides the model's thinking
 - **Examples** set the quality benchmark
